

Human Population 2018

Lecture 9
Climate change

Our extended forecast includes global warming & the catastrophic end of the human race. But for the weekend, it's looking like sunny skies, mild temperatures, & a general apathy toward environmental concerns.

Back to you, Jim.

Most of this radiation is absorbed by the Earth and warms it

Some energy is radiated back into space by the earth in the form of infrared waves

Some of this outgoing infrared radiation is trapped by the earth's atmosphere and warms it

A photograph showing a man's face and head being doused with water. The water is being poured from a clear plastic bottle that is attached to a larger, dark-colored container. The man's hair is dark and wet, and his face is splashed with water. The background is a dry, outdoor setting with some greenery and a tree. The overall scene suggests a relief effort during a heat wave.

Thailand is
experiencing its
worst drought in 60
years.

© 2016 AP Photo/Sakchai Lalit

A man in a light-colored shirt and blue pants, wearing a white turban, stands in a vast, cracked, and dry field. He is holding a large, cylindrical, light-colored container to his mouth and drinking. The field is filled with deep, irregular cracks in the dark, parched earth, with sparse green grass growing in the crevices. In the background, a flat landscape extends to a distant horizon under a cloudy sky. The overall scene conveys the severity of a drought.

Maharashtra State, India
May 10, 2016

Over 400 farmers in Maharashtra committed suicide in the first four months of 2016, due mainly to pressures from the ongoing regional drought.

Positive feedback effects of arctic ice decline.

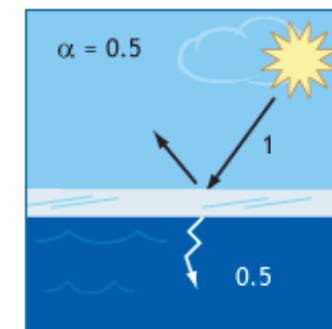

Ice albedo effect. Ice reflects more light than the open ocean.

Ice with Snow

Bare Ice

Open Ocean

Positive feedback effects of arctic ice decline.

Heat of fusion of water is 79.72 cal/g. Heat capacity of liquid water is 1.0 cal/deg/g. Therefore the amount of heat that it took to melt one g of ice will heat the meltwater from 0°C to 80°C.

Positive feedback effects of arctic ice decline.

Methane (CH_4) is stored in permafrost under the ocean as caged gas, or clathrate. As the ocean warms, the clathrates melt, releasing the CH_4 gas, which bubbles up to the surface. CH_4 has a much higher (150x) greenhouse gas potential than CO_2 , and has a half-life in the atmosphere of decades.

The East Siberian Sea sediments contain 100 to 1000x more carbon than all of the methane currently in the atmosphere.

India 2.5
▲2.0% (+0.2% to +3.8%)

Hypothetical model for emissions goal of zero in 2050

Exponential decline model is selected because fossil fuels will be forced downward "externally" (i.e. not due to declining availability). Exponential decline is appropriate when the growth of an alternative (i.e. solar) is exponential. Decline will be even faster if population also declines.

The rise of renewables!

A model for tree growth.

A tree growing in the open collects an amount of radiant energy roughly proportional to its leaf area. The JABOWA growth rate equation for a tree growing under optimum conditions has the form:

$$\delta(D^2H) = R \cdot LA \cdot \left(1 - \frac{DH}{D_{\max}H_{\max}}\right) \quad (1)$$

in which D is the dbh of the tree, H its height, with D_{\max} and H_{\max} being maximum values of these quantities for a given species, LA is the leaf area, and R is a constant. The equation states that the change in volume (D^2H) of a tree over a period of 1 year is proportional to the amount of sunlight which the tree receives, derated by a factor $(1 - DH/D_{\max}H_{\max})$ which takes some account of the energy required to maintain the living tissue. The right-hand side of eqn (1) is later multiplied by additional factors to take shading, climate, etc. into account. Values used in JABOWA version 1 for D_{\max} , H_{\max} and other parameters are given in Table 1.
